

CSS Text Shadow

The **text-shadow** property adds shadow to text.

In its simplest use, you only specify the horizontal shadow (2px) and the vertical shadow (2px):

Text shadow effect!

Example

```
h1 {  
  text-shadow: 2px 2px red;  
}
```

Then, add a blur effect (5px) to the shadow:

Text shadow effect!

Example

```
h1 {  
  text-shadow: 2px 2px 5px red;  
}
```
